

20260716: Onboarding, gLike familiarity

Done today

- Continued onboarding paperwork through USC Workday
 - @jonmah need TrojanLearn training for:
 - Cybersecurity [**complete**]
 - Workplace violence [**complete**]
 - Harassment prevention [2.5 hours]
 - Integrity and accountability [**complete**]
 - Injury and illness [**complete**]
- Troubleshooting gLike installation
 - Defined conda env gLike_opt on hoffman2 cluster (@jonmah need to transfer workflow to USC cluster), python=3.7
 - Try `python3 import glike:`
 - `import tskit`
 - `import numpy`
 - `import scipy`
 - `import msprime`
 - `import tsinfer`
 - `import cffi`
 - Try: `conda install -c conda-forge gcc_linux-64 gxx_linux-64`
 - Try: `pip install lmbd`
 - Issue: `cc1: fatal error: /work/tmp/pip-install-yv5mq6sk/lmbd_42bd448b4eeb446a8449b12286b13737/build/lib/mdb.c: No such file or directory`
 - Sounds like some sort of cc1 C compiling issue

- Note: gLike requires working C environment -- is this the problem?
 - Import error: Traceback (most recent call last):
 - File "/u/home/j/jonmah/project-ngarud/miniconda3/envs/gLike_opt/lib/python3.7/site-packages/lmdb/__init__.py", line 44, in <module>
- Let's be more clever and use a non-global installation for a C compiler in our conda environment
 - Try: `conda create --name gLike_opt python=3.8`
 - Try: `conda install -c conda-forge c-compiler cxx-compiler`
 - `$CC --version`
 - `x86_64-conda-linux-gnu-cc (conda-forge gcc 14.3.0-18) 14.3.0`
 - `python3 -m pip install ./glike_optimize/`
 - This didn't work
- Instead of using an internal C and C++ compiler, let's just update our global C compiler: `gcc/4.9.3 --> gcc/11.3.0`
 - Try: `import glike`
 - `import msprime`
 - `import pandas`
 - `import tsinfer`
 - `import cffi`
 - This is still not working, I'll try with the USC computing cluster
- Reached out to Bryan re: Hawaiian GWAS meta-analysis
- Reached out to Xinran re: Terra

TODO

- Continue working on installation
 - Idea: Try on local, where I actually have sudo access
 - Idea: Docker image?

- USC cluster (CARC) access:
 - [Link 1](#)
 - [Link 2](#)
 - Who is our technical contact? [Is this me or is this the principal investigator?]
 - Who is the account owner / business owner? Is this the PI?
 - Does my USC AWS account need to be HIPAA compliant?
 - Who is our purchasing officer?
 - Does my USC AWS account require GovCloud [research funded by certain government agencies]
 - Do we need access to the USC Datacenter?
 - Purchase order number
- Project overview:
 - Code review for gLike [in progress: installation / troubleshooting / cluster access]
 - Bug fix for likelihood calculation
 - This is startable without installation
 - Native Hawaiian data [Bryan's GAS meta-analysis]:

Reach(ed) out to Bryan

 - WGS data from Hawaiians to make imputation reference panel for Hawaiian and Japanese populations
 - Post reference panel with Michigan Imputation Server for public release
 - My role: while paper is being written and submitted, I am to help coordinate posting of the reference panel
 - Native Hawaiian WGS samples (500 individuals):

Reach(ed) out to Xinran

 - 546 files sitting in our cloud (why is the cloud called Terra)
 - Talk to Xinran to get a Terra account / access to the Terra workspace
 - What is the standard for joint multi-sample variant calling?
 - Merge data into a single multi-sample vcf
